IGGOUG: The New Users Group On The Block

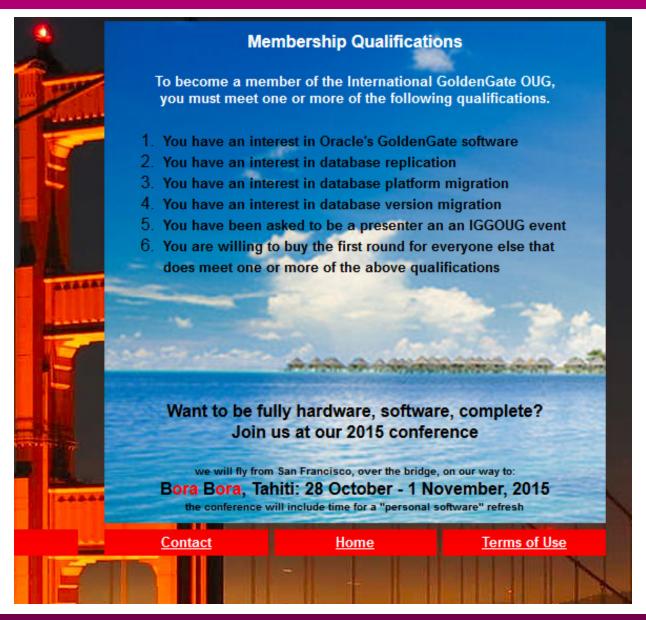

www.iggoug.org

OpenWorld Birds-of-a-Feather Session

- If you are coming to OpenWorld and are interested in GoldenGate there is a special session on Tuesday evening at 6:30pm ... location to be announced on the IGGOUG website within a week.
- This will be the place to meet the GG product management and help form the new group.

www.iggoug.org

IGGOUG 2015 Conference

Disclaimer

- This room is an unsafe harbour
- No one from Oracle has previewed this presentation
- No one from Oracle knows what I'm going to say
- No one from Oracle has supplied any of my materials
- This presentation is about capabilities built into the Oracle database that Oracle has never promoted but that can have a substantial impact on database performance

Why Is An ACE Director Focusing On Insert Statements?

- Because no one else is
- Because Oracle University doesn't teach this material
- Because there are 17 pages in the 12c docs on INSERT
- Because almost no one knows the full syntax for basic DML statements
- Because we have now spent more than 30 years talking about performance tuning and yet the number one conference and training topic remains tuning which proves that we need to stop focusing on edge cases and focus, instead, on the basics
- Because explain plans, AWR Reports, and trace files will never fix a problem if you don't know the full range of syntaxes available
- Because the best way to achieve high performance is to choose techniques that reduce resource utilization

Insert Statements

What Is SQL DML?

- DML stands for Data Manipulation Language
- DML is a direct reference to the following SQL statements
 - INSERT
 - UPDATE
 - DELETE
 - MERGE

SQL INSERT Statement Topics (1:2)

- Basic Insert
- INSERT WHEN
- INSERT ALL
- INSERT ALL WHEN
- INSERT FIRST WHEN
- INSERT INTO A SELECT STATEMENT
- INSERT WITH CHECK OPTION
- View Inserts
- Editioning View Inserts
- Partitioned Table Insert

SQL INSERT Statement Topics (2:2)

- Tables with Virtual Columns Insert
- Tables with Hidden Columns Insert
- Create Table As Inserts
- Nested Table Inserts
- VARRAY Table Inserts
- MERGE Statement Insert

PL/SQL INSERT Statement Topics

- Record inserts
- FORALL INSERTs
- FORALL MERGE Inserts
- LOB Inserts
- DBMS_SQL Dynamic Inserts
- Native Dynamic SQL Inserts
- RETURNING Clause with a Sequence
- RETURNING Clause with an Identity Column

Performance Tuning INSERT Statement Topics

- Too Many Columns
- Column Ordering
- Aliasing and Fully Qualified Names
- Implicit Casts
- APPEND hint
- APPEND_VALUES hint
- DBMS_ERRLOG built-in package
 - CHANGE_DUPKEY_ERROR_INDEX hint
 - IGNORE_ON_DUPKEY_INDEX hint
- DBMS_STATS
- Insert Statement Most Common Error

SQL Insert Statements

Basic INSERT Statement (1:2)

 Use this syntax to perform inserts into a single column in a heap, global temporary, IOT, or most partitioned tables

```
INSERT INTO <table_name>
  (<column_name>)
VALUES
  (<value>);
```

```
CREATE TABLE state (
state_abbrev VARCHAR2(2));

INSERT INTO state
(state_abbrev)

VALUES
('NY');

COMMIT;

SELECT * FROM state;
```

Basic INSERT Statement (2:2)

 Use this syntax to perform inserts into multiple columns in a heap, global temporary, IOT, or most partitioned tables

```
INSERT INTO <table_name>
  (<column_name>, <column_name> [,...])
VALUES
  (<value>, <value> [,<value>]);
```

```
CREATE TABLE state (
state_abbrev VARCHAR2(2),
state_name VARCHAR2(30));

INSERT INTO state
(state_abbrev, state_name)
VALUES
('NY', 'New York');

COMMIT;

SELECT * FROM state;
```

INSERT WHEN

Use this syntax to conditionally insert rows into multiple

tables

```
INSERT
WHEN (<condition>) THEN
   INTO <table_name> (<column_list>)
   VALUES (<values_list>)
WHEN (<condition>) THEN
   INTO <table_name> (<column_list>)
   VALUES (<values_list>)
ELSE
   INTO <table_name> (<column_list>)
   VALUES (<values_list>)
SELECT <column_list> FROM <table_name>;
```

```
INSERT
WHEN (deptno=10) THEN
   INTO emp_10 (empno,ename,job,mgr,sal,deptno)
   VALUES (empno,ename,job,mgr,sal,deptno)
WHEN (deptno=20) THEN
   INTO emp_20 (empno,ename,job,mgr,sal,deptno)
   VALUES (empno,ename,job,mgr,sal,deptno)
WHEN (deptno=30) THEN
   INTO emp_30 (empno,ename,job,mgr,sal,deptno)
   VALUES (empno,ename,job,mgr,sal,deptno)
   VALUES (empno,ename,job,mgr,sal,deptno)
   VALUES (empno,ename,job,mgr,sal,deptno)
   VALUES (empno,ename,job,mgr,sal,deptno)
   VALUES (empno,ename,job,mgr,sal,deptno)
   VALUES (empno,ename,job,mgr,sal,deptno)
   SELECT * FROM emp;
```

INSERT ALL

- Use this syntax to unconditionally insert data into multiple tables
- Note that some columns go into one table ... others into both

```
INSERT ALL
INTO <table_name> VALUES <column_name_list)
INTO <table_name> VALUES <column_name_list)
...
<SELECT Statement>;
```

```
INSERT ALL
   INTO ap_cust VALUES (customer_id, program_id, delivered_date)
   INTO ap_orders VALUES (order_date, program_id)
SELECT program_id, delivered_date, customer_id, order_date
FROM airplanes;
```

INSERT ALL WHEN

 With "ALL", the default value, the database evaluates each WHEN sequentially

```
INSERT ALL
WHEN (<condition>) THEN
  INTO <table_name> (<column_list>)
  VALUES (<values_list>)
WHEN (<condition>) THEN
  INTO <table_name> (<column_list>)
  VALUES (<values_list>)
ELSE
  INTO <table_name> (<column_list>)
  VALUES (<values_list>)
SELECT <column_list> FROM <table_name>;
```

```
INSERT ALL
WHEN (deptno=10) THEN
   INTO emp_10 (empno, ename, job, mgr, sal, deptno)
   VALUES (empno, ename, job, mgr, sal, deptno)
WHEN (deptno=20) THEN
   INTO emp_20 (empno, ename, job, mgr, sal, deptno)
   VALUES (empno, ename, job, mgr, sal, deptno)
WHEN (deptno<=30) THEN
   INTO emp_30 (empno, ename, job, mgr, sal, deptno)
   VALUES (empno, ename, job, mgr, sal, deptno)
   ELSE
   INTO leftover (empno, ename, job, mgr, sal, deptno)
   VALUES (empno, ename, job, mgr, sal, deptno)
   VALUES (empno, ename, job, mgr, sal, deptno)
   SELECT * FROM emp;</pre>
```

INSERT FIRST WHEN

 With FIRST the database evaluates each WHEN clause in the order in which it appears in the statement

```
INSERT FIRST
WHEN <condition> THEN
INTO <table_name> VALUES <column_name_list)
INTO <table_name> VALUES <column_name_list)
...
<SELECT Statement>;
```

```
INSERT FIRST
WHEN customer_id < 'I' THEN
   INTO cust_ah
   VALUES (customer_id, program_id, delivered_date)
WHEN customer_id < 'Q' THEN
   INTO cust_ip
   VALUES (customer_id, program_id, delivered_date)
WHEN customer_id > 'PZZZ' THEN
   INTO cust_qz
   VALUES (customer_id, program_id, delivered_date)
SELECT program_id, delivered_date, customer_id, order_date
FROM airplanes;
```

INSERT Into A SELECT Statement

 Use this syntax to INSERT rows into one table as part of a SELECT statement from itself or a different table or tables

```
INSERT INTO <table_name> <SELECT Statement>;
```

INSERT with Check Option

 Use this syntax to limit inserted rows to those that pass CHECK OPTION validation

```
INSERT INTO (
     <SQL_statement> WITH CHECK OPTION)
     VALUES
     (value_list);
```

```
INSERT INTO (
SELECT deptno, dname, loc
FROM dept
WHERE deptno < 30 WITH CHECK OPTION)
VALUES (99, 'TRAVEL', 'SEATTLE');</pre>
```

INSERTing Into A View

- Evaluate whether a view column is insertable
- Views with aggregations, CONNECT BY, and other syntaxes may not be insertable

```
desc cdb_updatable_columns
SELECT cuc.con_id, cuc.owner, cuc.insertable, COUNT(*)
FROM cdb updatable columns cuc
WHERE (cuc.con id, cuc.owner, cuc.table name) IN
  (SELECT cv.con_id, cv.owner, cv.view_name
   FROM cdb_views cv)
GROUP BY cuc.con_id, cuc.owner, cuc.insertable
ORDER BY 1,2,3;
 CON_ID
           OWNER
                                      INS
                                            COUNT (*)
         2 ORDSYS
                                      NO
         2 ORDSYS
                                      YES
         2 SYS
                                      NO
                                               45190
         2 SYS
                                      YES
                                               22415
         2 SYSTEM
                                      NO
                                                 172
         2 SYSTEM
                                      YES
                                                  14
         2 WMSYS
                                      NO
                                                 736
         2 WMSYS
                                      YES
                                                 160
```

INSERTing Into An Editioning View

 All editioning views are insertable ... but be sure you are in the correct edition

```
SQL> CREATE EDITION demo_ed;
SQL> CREATE OR REPLACE EDITIONING VIEW test AS
 2 SELECT program id, line number
 3 FROM airplanes;
View created.
SQL> ALTER SESSION SET EDITION=demo ed;
Session altered.
SOL> CREATE OR REPLACE EDITIONING VIEW test AS
 2 SELECT line_number, program_id
 3 FROM airplanes;
View created.
SQL> SELECT * FROM user_editioning_views_ae;
VIEW NAME
          TABLE_NAME
                                    EDITION NAME
TEST
           AIRPLANES
                                    ORA$BASE
TEST
            AIRPLANES
                                    DEMO ED
```

INSERTing Into A Partitioned Table

- With HASH, LIST, and RANGE partitioning any INSERT statement will work
- With Partition by SYSTEM you must think more clearly

```
CREATE TABLE syst_part (
tx id
      NUMBER(5),
begdate DATE)
PARTITION BY SYSTEM (
PARTITION p1,
PARTITION p2,
PARTITION p3);
INSERT INTO syst_part VALUES (1, SYSDATE-10);
ERROR at line 1:
ORA-14701: partition-extended name or bind variable must be used for DMLs on tables
partitioned by the System method
INSERT INTO syst_part PARTITION (p1) VALUES (1, SYSDATE-10);
INSERT INTO syst part PARTITION (p2) VALUES (2, SYSDATE);
INSERT INTO syst part PARTITION (p3) VALUES (3, SYSDATE+10);
SELECT * FROM syst_part PARTITION(p2);
```

INSERTing Into A Table With Virtual Columns

Virtual columns will appear in a DESCRIBE statement but you cannot insert into them directly

```
CREATE TABLE vcol (
salary NUMBER(8),
bonus NUMBER(3),
total_comp NUMBER(10) AS (salary+bonus));
desc vcol
SELECT column_id, column_name, virtual_column
FROM user_tab_cols
WHERE table_name = 'VCOL'
INSERT INTO vcol
(salary, bonus, total_comp)
VALUES
(1,2,3);
INSERT INTO vcol
(salary, bonus)
VALUES
(1,2);
SELECT * FROM vcol;
```

INSERTing Into A Table With Invisible Columns

 Invisible columns will <u>not</u> appear in a DESCRIBE statement but you can insert into them directly

```
CREATE TABLE vis (
rid
        NUMBER,
testcol VARCHAR2(20));
CREATE TABLE invis (
rid
      NUMBER,
testcol VARCHAR2(20) INVISIBLE);
desc vis
desc invis
SELECT table_name, column_name, hidden_column
FROM user tab cols
                                                -- not in user tab columns
WHERE table name like '%VIS';
INSERT INTO invis
(rid, testcol)
VALUES
(1, 'TEST');
SELECT * FROM invis;
SELECT rid, testcol FROM invis;
```

CREATE TABLE AS INSERTS

 Use this syntax to create a new table as the result of a SELECT statement

```
CREATE TABLE <table_name>
AS <SELECT Statement>;
```

```
CREATE TABLE column_subset AS
SELECT col1, col3, col5
FROM servers;

desc column_subset

SELECT COUNT(*)
FROM column_subset;
```

Nested Table Insert

Cast column values using the object column's data type

```
CREATE OR REPLACE NONEDITIONABLE TYPE CourseList AS TABLE OF VARCHAR2(64);
CREATE TABLE department (
     VARCHAR2(20),
name
director VARCHAR2(20),
office VARCHAR2(20),
courses CourseList)
NESTED TABLE courses STORE AS courses_tab;
INSERT INTO department
(name, director, office, courses)
VALUES
('English', 'Tara Havemeyer', 'Breakstone Hall 205', CourseList(
'Expository Writing',
'Film and Literature',
'Modern Science Fiction',
'Discursive Writing',
'Modern English Grammar',
'Introduction to Shakespeare',
'Modern Drama',
'The Short Story',
'The American Novel'));
```

VARRAY Table Insert

Cast column values using the VARRAY column's data type

```
CREATE OR REPLACE TYPE ProjectList AS VARRAY(50) OF Project;

CREATE TABLE department (
dept_id NUMBER(2),
dname VARCHAR2(15),
budget NUMBER(11,2),
projects ProjectList);

INSERT INTO department
VALUES(30, 'Accounting', 1205700,
ProjectList (Project(1, 'Design New Expense Report', 3250),
Project(2, 'Outsource Payroll', 12350),
Project(3, 'Evaluate Merger Proposal', 2750),
Project(4, 'Audit Accounts Payable', 1425)));
```

MERGE Statement Insert

 Use MERGE statements where an insert or other DML is conditioned on the results of a SELECT statement

```
MERGE INTO bonuses b
USING (
    SELECT employee_id, salary, dept_no
    FROM employee
    WHERE dept_no =20) e
ON (b.employee_id = e.employee_id)
WHEN MATCHED THEN
    UPDATE SET b.bonus = e.salary * 0.1
    DELETE WHERE (e.salary < 40000)
WHEN NOT MATCHED THEN
    INSERT (b.employee_id, b.bonus)
    VALUES (e.employee_id, e.salary * 0.05)
    WHERE (e.salary > 40000);
```

PL/SQL Insert Statements

Record Inserts

 Use this syntax to insert based on an array that matches the target table rather than named individual columns

```
CREATE TABLE t AS
SELECT table_name, tablespace_name
FROM all_tables;
SELECT COUNT(*)
FROM t;
DECLARE
trec t%ROWTYPE;
BEGIN
 trec.table name := 'NEW';
 trec.tablespace_name := 'NEW_TBSP';
  INSERT INTO t
 VALUES trec;
  COMMIT;
END;
SELECT COUNT(*) FROM t;
```

FORALL INSERTS (1:3)

- Use this syntax to greatly enhance performance but be sure you understand the concept of DIRECT LOAD INSERTs
- With this syntax I can insert 500,000 rows per second on my laptop
- Learn
 - Limits Clause
 - Save Exceptions
 - Partial Collections
 - Sparse Collections
 - In Indices Of Clause

```
CREATE OR REPLACE PROCEDURE fast_way AUTHID CURRENT_USER IS
 TYPE myarray IS TABLE OF parent%ROWTYPE;
 l_data myarray;
 CURSOR r IS
 SELECT part_num, part_name
 FROM parent;
 BatchSize CONSTANT POSITIVE := 1000;
BEGIN
  OPEN r;
  LOOP
    FETCH r BULK COLLECT INTO l_data LIMIT BatchSize;
    FOR j IN 1 .. l_data.COUNT LOOP
      l_data(j).part_num := l_data(j).part_num * 10;
    END LOOP;
    FORALL i IN 1..l_data.COUNT
    INSERT INTO child VALUES l_data(i);
    EXIT WHEN l_data.COUNT < BatchSize;
  END LOOP;
  COMMIT;
  CLOSE r;
END fast_way;
```

FORALL INSERTS (2:3)

- Use this syntax to greatly enhance performance but be sure you understand the concept of DIRECT LOAD INSERTs
- With this syntax I can insert 500,000 rows per second on my laptop
- Learn
 - Limits Clause
 - Save Exceptions
 - Partial Collections
 - Sparse Collections
 - In Indices Of Clause

```
CREATE OR REPLACE PROCEDURE fast_way AUTHID CURRENT_USER IS
 TYPE PartNum IS TABLE OF parent.part_num%TYPE
 INDEX BY BINARY INTEGER;
 pnum_t PartNum;
 TYPE PartName IS TABLE OF parent.part_name%TYPE
 INDEX BY BINARY_INTEGER;
pnam_t PartName;
BEGIN
  SELECT part_num, part_name
  BULK COLLECT INTO pnum_t, pnam_t
  FROM parent;
  FOR i IN pnum_t.FIRST .. pnum_t.LAST LOOP
    pnum_t(i) := pnum_t(i) * 10;
  END LOOP;
  FORALL i IN pnum_t.FIRST .. pnum_t.LAST
  INSERT INTO child
  (part_num, part_name)
 VALUES
  (pnum_t(i), pnam_t(i));
  COMMIT;
END fast_way;
```

FORALL INSERTS (3:3)

- Use this syntax to greatly enhance performance but be sure you understand the concept of DIRECT LOAD INSERTs
- With this syntax I can insert 500,000 rows per second on my laptop
- Learn
 - Limits Clause
 - Save Exceptions
 - Partial Collections
 - Sparse Collections
 - In Indices Of Clause

```
CREATE OR REPLACE PROCEDURE fast_way AUTHID CURRENT_USER IS
 TYPE parent_rec IS RECORD (
 part_num
            dbms_sql.number_table,
 part_name dbms_sql.varchar2_table);
 p_rec parent_rec;
 CURSOR c IS
 SELECT part_num, part_name FROM parent;
 l_done BOOLEAN;
BEGIN
 OPEN c;
 LOOP
    FETCH c BULK COLLECT INTO p_rec.part_num, p_rec.part_name
   LIMIT 500;
   l_done := c%NOTFOUND;
   FOR i IN 1 .. p_rec.part_num.COUNT LOOP
      p_rec.part_num(i) := p_rec.part_num(i) * 10;
    END LOOP;
    FORALL i IN 1 .. p_rec.part_num.COUNT
    INSERT INTO child
    (part_num, part_name)
   VALUES
    (p_rec.part_num(i), p_rec.part_name(i));
    EXIT WHEN (l_done);
 END LOOP;
 COMMIT;
 CLOSE c;
END fast_way;
```

FORALL MERGE Inserts

Use this syntax to perform MERGE statements using array data

```
CREATE OR REPLACE PROCEDURE forall_merge AUTHID CURRENT_USER IS
TYPE ridVal IS TABLE OF forall_tgt.rid%TYPE
INDEX BY BINARY_INTEGER;
l data ridVal;
BEGIN
  SELECT rid BULK COLLECT INTO l_data
 FROM forall_src;
 FORALL i IN l_data.FIRST .. l_data.LAST
 MERGE INTO forall tgt ft
 USING (
    SELECT rid
   FROM forall src fs
   WHERE fs.rid = 1 data(i)) al
  ON (al.rid = ft.rid)
  WHEN MATCHED THEN
   UPDATE SET upd = 'U'
 WHEN NOT MATCHED THEN
   INSERT (rid, ins, upd)
   VALUES (l_data(i), 'I', NULL);
 COMMIT;
END forall_merge;
```

LOB Inserts

 When creating LOB objects be sure to use SecureFiles and be sure that you understand PCTVERSION, CHUNK, and other storage parameters

```
DECLARE
 src_file BFILE;
 dst_file BLOB;
 lgh_file BINARY_INTEGER;
 retval VARCHAR2(30);
BEGIN
  src_file := bfilename('CTEMP', 'sphere.mpg');
  INSERT INTO sct
  (rid, bcol)
  VALUES
  (1, EMPTY_BLOB())
  RETURNING bcol INTO dst_file;
  SELECT bcol
 INTO dst_file
  FROM sct
 WHERE rid = 1
 FOR UPDATE;
  dbms_lob.fileopen(src_file, dbms_lob.file_readonly);
  lgh_file := dbms_lob.getlength(src_file);
  dbms_lob.loadFromFile(dst_file, src_file, lgh_file);
  UPDATE sct
  SET bcol = dst file
  WHERE rid = 1;
  dbms_lob.setContentType(dst_file, 'MPG Movie');
  retval := dbms_lob.getContentType(dst_file);
  dbms_output.put_line(retval);
 dbms_lob.fileclose(src_file);
END load_file;
```

DBMS_SQL Dynamic Inserts

 DBMS_SQL is the legacy implementation of dynamic SQL in the Oracle database introduced in version 7.3.4.

```
CREATE OR REPLACE PROCEDURE single_row_insert(c1 NUMBER, c2 NUMBER, r OUT NUMBER) IS c NUMBER;
n NUMBER;
BEGIN
c := dbms_sql.open_cursor;

dbms_sql.parse(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
'RETURNING c1*c2 into :bnd3', 2);

dbms_sql.bind_variable(c, 'bnd1', c1);
dbms_sql.bind_variable(c, 'bnd2', c2);
dbms_sql.bind_variable(c, 'bnd3', r);

n := dbms_sql.execute(c);

dbms_sql.variable_value(c, 'bnd3', r); -- get value of outbind
dbms_sql.close_cursor(c);
END single_row_insert;
/
```

Native Dynamic SQL Inserts

 Native Dynamic SQL has largely replaced DBMS_SQL as it is robust and more easily coded

```
BEGIN

FOR i IN 1 .. 10000

LOOP

EXECUTE IMMEDIATE 'INSERT INTO t VALUES (:x)'

USING i;

END LOOP;

END;

/
```

RETURNING Clause with a Sequence

 Use this syntax to return values from an insert statement unknown to the program inserting the row

```
INSERT INTO <table_name>
  (column_list)
  VALUES
  (values_list)
  RETURNING <value_name>
  INTO <variable_name>;
```

```
DECLARE
  x emp.empno%TYPE;
  r rowid;
BEGIN
  INSERT INTO emp
  (empno, ename)
  VALUES
  (seq_emp.NEXTVAL, 'Morgan')
  RETURNING rowid, empno
  INTO r, x;

  dbms_output.put_line(r);
  dbms_output.put_line(x);
END;
/
```

RETURNING Clause with an Identify Column

 Use this syntax to return values from an insert statement unknown to the program inserting the row

```
CREATE TABLE idcoltab (
rec_id NUMBER GENERATED ALWAYS AS IDENTITY,
coltxt VARCHAR2(30));
```

```
DECLARE
  rid idcoltab.rec_id%TYPE;
BEGIN
    INSERT INTO idcoltab
    (coltxt)
    VALUES
    ('Morgan')
    RETURNING rec_id
    INTO rid;

    dbms_output.put_line(rid);
END;
/
```

Performance Tuning Insert Statements

Too Many Columns (1:2)

- Oracle claims that a table can contain up to 1,000 columns: It is not true
- The maximum number of real table columns is 255
- Break the 255 barrier and optimizations such as advanced and hybrid columnar compression no longer work
- A 1,000 column table is actually four tables joined together seamlessly behind the scenes just as a partitioned table appears to be a single segment but isn't
- Be suspicious of any table with more than 50 columns. At 100 columns it is time to reread the Codd-Date rules on normalization
- Think vertically not horizontally

Too Many Columns (2:2)

- Be very suspicious of any table with column names in the form "SPARE1", "SPARE2"
- The more columns a table has the more cpu is required when accessing columns to the right (as the table is displayed in a SELECT * query)

Column Ordering (1:3)

- Computers are not humans and tables are not paper forms
- CBO's column retrieval cost
 - Oracle stores columns in variable length format
 - Each row is parsed in order to retrieve one or more columns
 - Each subsequently parsed column introduces a cost of 20 cpu cycles regardless of whether it is of value or not

Column Ordering (2:3)

 These tables will be accessed by person_id or state: No one will ever put the address2 column into the WHERE clause as a filter

```
CREATE TABLE customers (
person_id NUMBER,
first_name VARCHAR2(30) NOT NULL,
middle_init VARCHAR2(2),
last_name VARCHAR2(30) NOT NULL,
address1 VARCHAR2(30),
address2 VARCHAR2(30),
city VARCHAR2(30),
state VARCHAR2(2));
```

```
CREATE TABLE customers (
person_id NUMBER,
last_name VARCHAR2(30) NOT NULL,
state VARCHAR2(2) NOT NULL,
city VARCHAR2(30) NOT NULL,
first_name VARCHAR2(30) NOT NULL,
address1 VARCHAR2(30),
address2 VARCHAR2(30),
middle_init VARCHAR2(2));
```

Column Ordering (3:3)

Proof column order matters

```
CREATE TABLE read test AS
SELECT *
FROM apex_040200.wwv_flow_page_plugs
WHERE rownum = 1;
SQL> explain plan for
 2 select * from read_test;
PLAN_TABLE_OUTPUT
| Id | Operation | Name | Rows | Bytes | Cost (%CPU) | Time |
0 | SELECT STATEMENT | 1 | 214K| 2 (0)| 00:00:01 |
| 1 | TABLE ACCESS FULL| READ_TEST | 1 | 214K| 2 (0)| 00:00:01 |
-- fetch value from column 1
Final cost for query block SEL$1 (#0) - All Rows Plan:
 Best join order: 1
 Cost: 2.0002 Degree: 1 Card: 1.0000 Bytes: 13
 Resc: 2.0002 Resc_io: 2.0000 Resc_cpu: 7271
 Resp: 2.0002 Resp_io: 2.0000 Resc_cpu: 7271
-- fetch value from column 193
Final cost for query block SEL$1 (#0) - All Rows Plan:
 Best join order: 1
 Cost: 2.0003 Degree: 1 Card: 1.0000 Bytes: 2002
 Resc: 2.0003 Resc_io: 2.0000 Resc_cpu: 11111
 Resp: 2.0003 Resp_io: 2.0000 Resc_cpu: 11111
```

Aliasing and Fully Qualified Names

- When you do not use fully qualified names Oracle must do the work for you
- You write code once ... the database executes it many times

```
SELECT DISTINCT s.srvr_id
FROM servers s, serv_inst i
WHERE s.srvr_id = i.srvr_id;

SELECT DISTINCT s.srvr_id
FROM uwclass.servers s, uwclass.serv_inst i
WHERE s.srvr_id = i.srvr_id;
```

Implicit Casts

 Code that does not correctly define data types will either fail to run or run very inefficiently

The following example shows both the correct way and the incorrect way to work with dates. The correct way is to perform an explicit cast

```
SQL> create table t (
  2 datecol date);

Table created.

SQL> insert into t values ('01-JAN-2012');

1 row created.

SQL> insert into t values (TO_DATE('01-JAN-2012'));

1 row created.
```

APPEND Hint

- The APPEND hint enables direct-path INSERT if the database is running in serial mode. The database is in serial mode if you are not using Enterprise Edition. Conventional INSERT is the default in serial mode, and direct-path INSERT is the default in parallel mode
- In direct-path INSERT data is appended above the high-water mark potentially improving performance

```
INSERT /*+ APPEND */ INTO t
SELECT * FROM servers;
```

APPEND_VALUES Hint (1:2)

- Use this <u>new 12c hint</u> instructs the optimizer to use directpath INSERT with the VALUES clause
- If you do not specify this hint, then conventional INSERT is used
- This hint is only supported with the VALUES clause of the INSERT statement
- If you specify it with an insert that uses the subquery syntax it is ignored

APPEND_VALUES Hint (2:2)

```
SOL> EXPLAIN PLAN FOR
2 INSERT INTO t
3 VALUES
4 ('XYZ');
SQL> SELECT * FROM TABLE(dbms_xplan.display);
| Id | Operation
                | Name | Rows | Bytes | Cost (%CPU)| Time |
1 | LOAD TABLE CONVENTIONAL | T | | | | | |
SQL> EXPLAIN PLAN FOR
2 INSERT /*+ APPEND VALUES */ INTO t
3 VALUES
4 ('XYZ');
SQL> SELECT * FROM TABLE (dbms xplan.display);
| Id | Operation | Name | Rows | Bytes | Cost (%CPU) | Time |
0 | INSERT STATEMENT | 1 | 100 | 1 (0) | 00:00:01 |
| 1 | LOAD AS SELECT | T |
2 | BULK BINDS GET |
```

DBMS_ERRLOG (1:2)

- Provides a procedure that enables creating an error logging table so that DML operations can continue after encountering errors rather than performing an abort and rollback
- Tables with LONG, CLOB, BLOB, BFILE, and ADT data types are not supported
- LOG ERRORS effectively it turns array processing into single row processing, so it adds an expense at the moment of inserting, even though it saves you the overhead of an array rollback if a duplicate gets into the data (Jonathan Lewis)

```
CREATE TABLE t AS
SELECT *
FROM all_tables
WHERE 1=2;

ALTER TABLE t
ADD CONSTRAINT pk_t
PRIMARY KEY (owner, table_name)
USING INDEX;

ALTER TABLE t
ADD CONSTRAINT cc_t
CHECK (blocks < 11);

INSERT /*+ APPEND */ INTO t
SELECT *
FROM all_tables;
```

DBMS_ERRLOG (2:2)

```
exec dbms_errlog.create_error_log('T');
desc err$_t
INSERT /*+ APPEND */ INTO t
SELECT *
FROM all tables
LOG ERRORS
REJECT LIMIT UNLIMITED;
SELECT COUNT(*) FROM t;
COMMIT;
SELECT COUNT(*) FROM t;
SELECT COUNT(*) FROM err$_t;
set linesize 121
col table_name format a30
col blocks format a7
col ora_err_mesg$ format a60
SELECT ora_err_mesg$, table_name,
blocks
FROM err$ t;
```

CHANGE_DUPKEY_ERROR_INDEX hint

- Use this hint to unambiguously identify a unique key violation for a specified set of columns or for a specified index
- When a unique key violation occurs for the specified index, an ORA-38911 error is reported instead of an ORA-00001

```
INSERT /*+ CHANGE_DUPKEY_ERROR_INDEX(T,TESTCOL) */ INTO t
  (testcol)
VALUES
  ('A');
```

IGNORE_ON_DUPKEY_INDEX hint

- This hint applies only to single-table INSERT operations
- It causes the statement to ignore a unique key violation for a specified set of columns or for a specified index
- When a unique key violation is encountered, a row-level rollback occurs and execution resumes with the next input row
- If you specify this hint when inserting data with DML error logging enabled, then the unique key violation is not logged and does not cause statement termination

```
INSERT /*+ IGNORE_ROW_ON_DUPKEY_INDEX(T,UC_T_TESTCOL)) */ INTO t
(testcol)
VALUES
(1);
```

DBMS_STATS

- System Stats
- Fixed Object Stats
- Dictionary Stats
- Set stats for new partitions so that when inserts take place the optimizer knows what you are inserting

```
exec dbms_stats.set_table_stats(USER, 'EMP', numrows=>1000000, numblks=>10000, avgrlen=>74);
exec dbms_stats.set_index_stats(USER, 'ix_emp_deptno', numrows=>1000000, numblks=>1000, numdist=>10000, clstfct=>1);
exec dbms_stats.set_column_stats(USER, 'emp', 'deptno', distcnt=>10000);
exec dbms_stats.set_table_stats(USER, 'dept', numrows=>100, numblks=>100);
```

INSERT Statement Most Common Error

 If you do not name columns DDL can break your statement and not doing so will use a less efficient code path

```
INSERT INTO <table_name>
    (<comma_separated_column_name_list>)
VALUES
    (<comma_separated_value_list>);
```

```
CREATE TABLE state (
state_abbrev VARCHAR2(2),
state_name VARCHAR2(30),
city_name VARCHAR2(30));

INSERT INTO state
(state_abbrev, state_name)
VALUES
('NY', 'New York');

INSERT INTO state
VALUES
('NY', 'New York');
```

Wrap Up

Conclusion

- How comfortable are you with your knowledge of UPDATE and DELETE statements?
- The most important principle in INSERT statements, and anything else in Oracle is "do the least work"
 - Minimize CPU utilization
 - Minimize I/O
 - Minimize network utilization
 - Bandwidth
 - Round Trips
 - Minimize your memory footprint

Hint Warning

 The following was written by Jonathan Lewis: I've never heard better advice

Rules for Hinting

- 1. Don't
- 2. If you must use hints, then assume you've used them incorrectly.
- 3. On every patch or upgrade to Oracle, assume every piece of hinted SQL is going to do the wrong thing. Because of (2) above; you've been lucky so far, but the patch/upgrade lets you discover your mistake.
- 4. Every time you apply some DDL to an object that appears in a piece of hinted SQL assume that the hinted SQL is going to do the wrong thing. Because of (2) above; you've been lucky so far, but the structural change lets you discover your mistake.

Questions

ERROR at line 1:

ORA-00028: your session has been killed
