Access Software**

Oracle Golden Gate provides **low-impact capture, routing, transformation**, and delivery of database transactions across heterogeneous environments in near-real time.

Oracle Golden Gate enables the exchange and manipulation of data at the transaction level among multiple, **heterogeneous platforms** across the enterprise.

Oracle Golden Gate moves **committed transactions from redo logs** and maintains transaction integrity with sub-second latency

# Oracle GoldenGate – Supported Platforms

Choice can be made from 2 types of **Oracle GoldenGate (OGG)**:

## Supported Databases

SYBASE®

TERADATA

Always check the latest Certification Matrix

## Supported Operating Systems

AIX, z/OS, iSeries, z/Linux

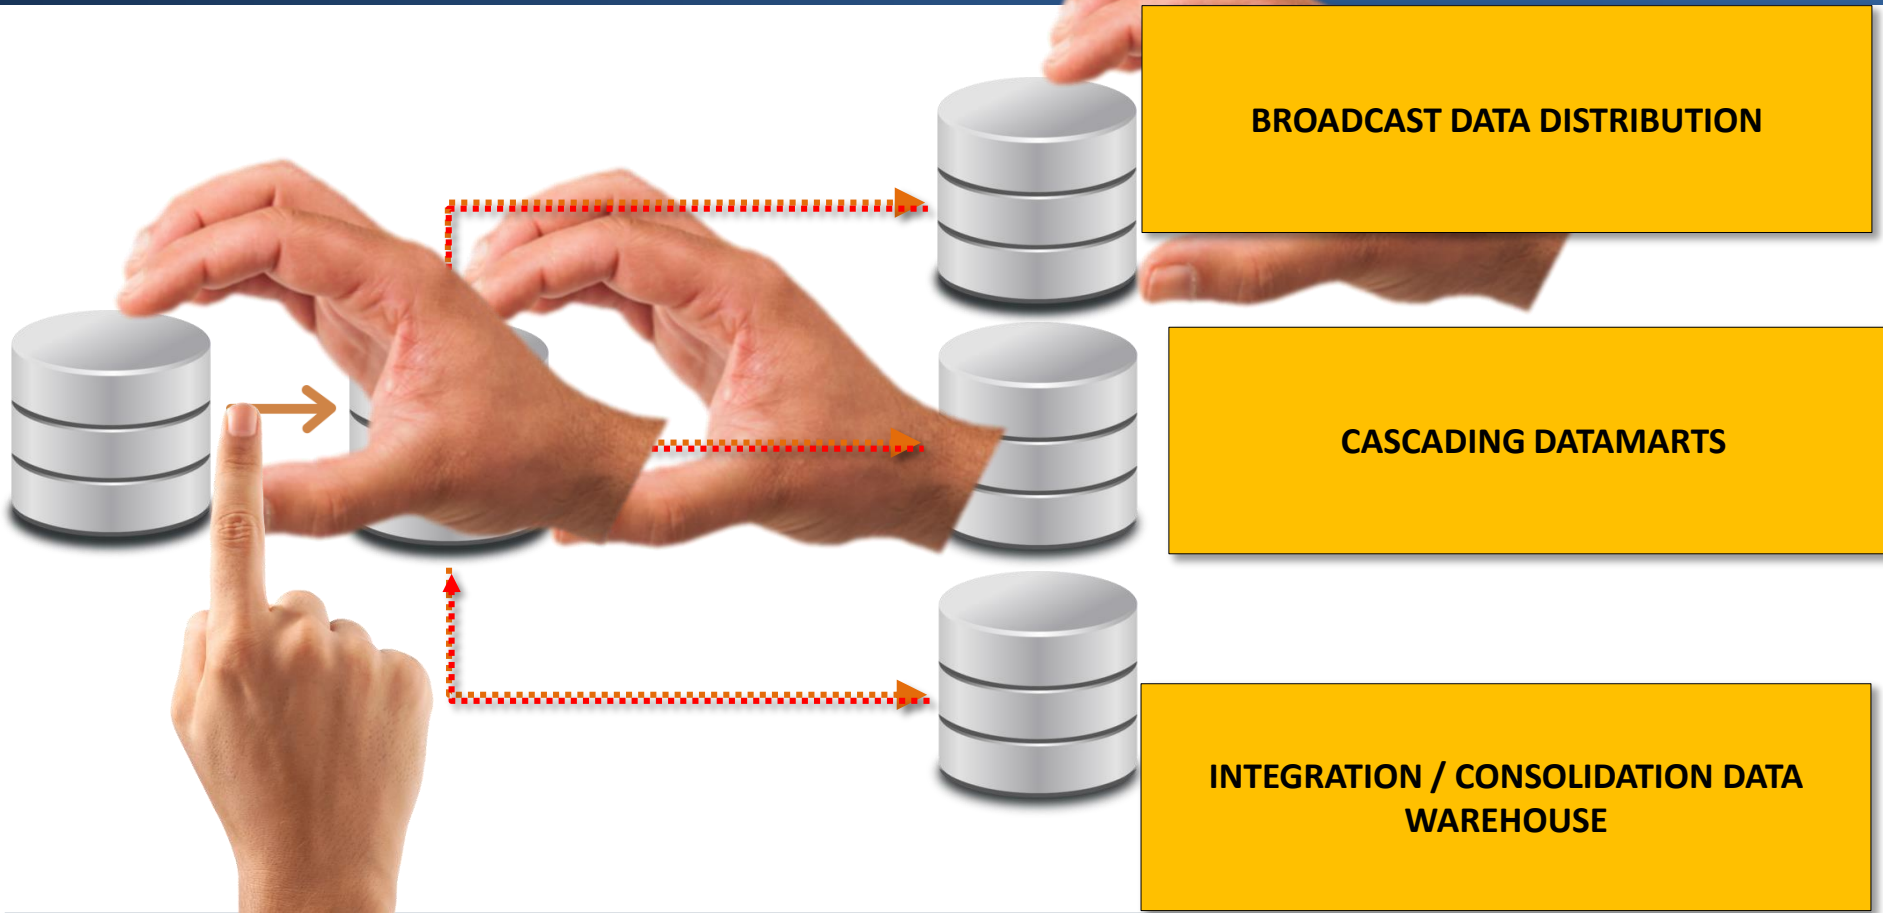

# Topologies

**UNIDIRECTIONAL QUERY OFFLOADING**

**BIDIRECTIONAL STANDBY DB OR ACTIVE-ACTIVE FOR HIGH-AVAILABILITY**

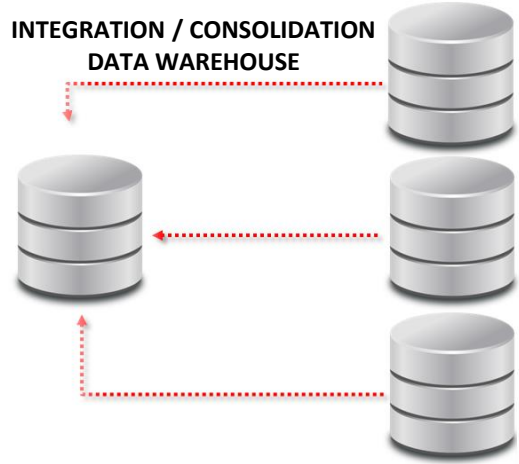

**PEER-TO-PEER LOAD BALANCING, MULTIMASTER**

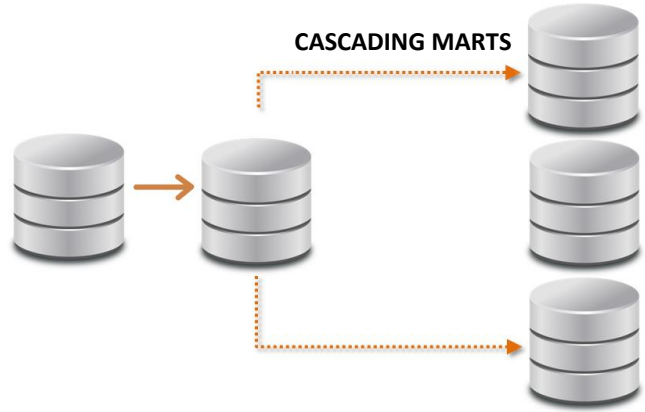

**BROADCAST DATA DISTRIBUTION**

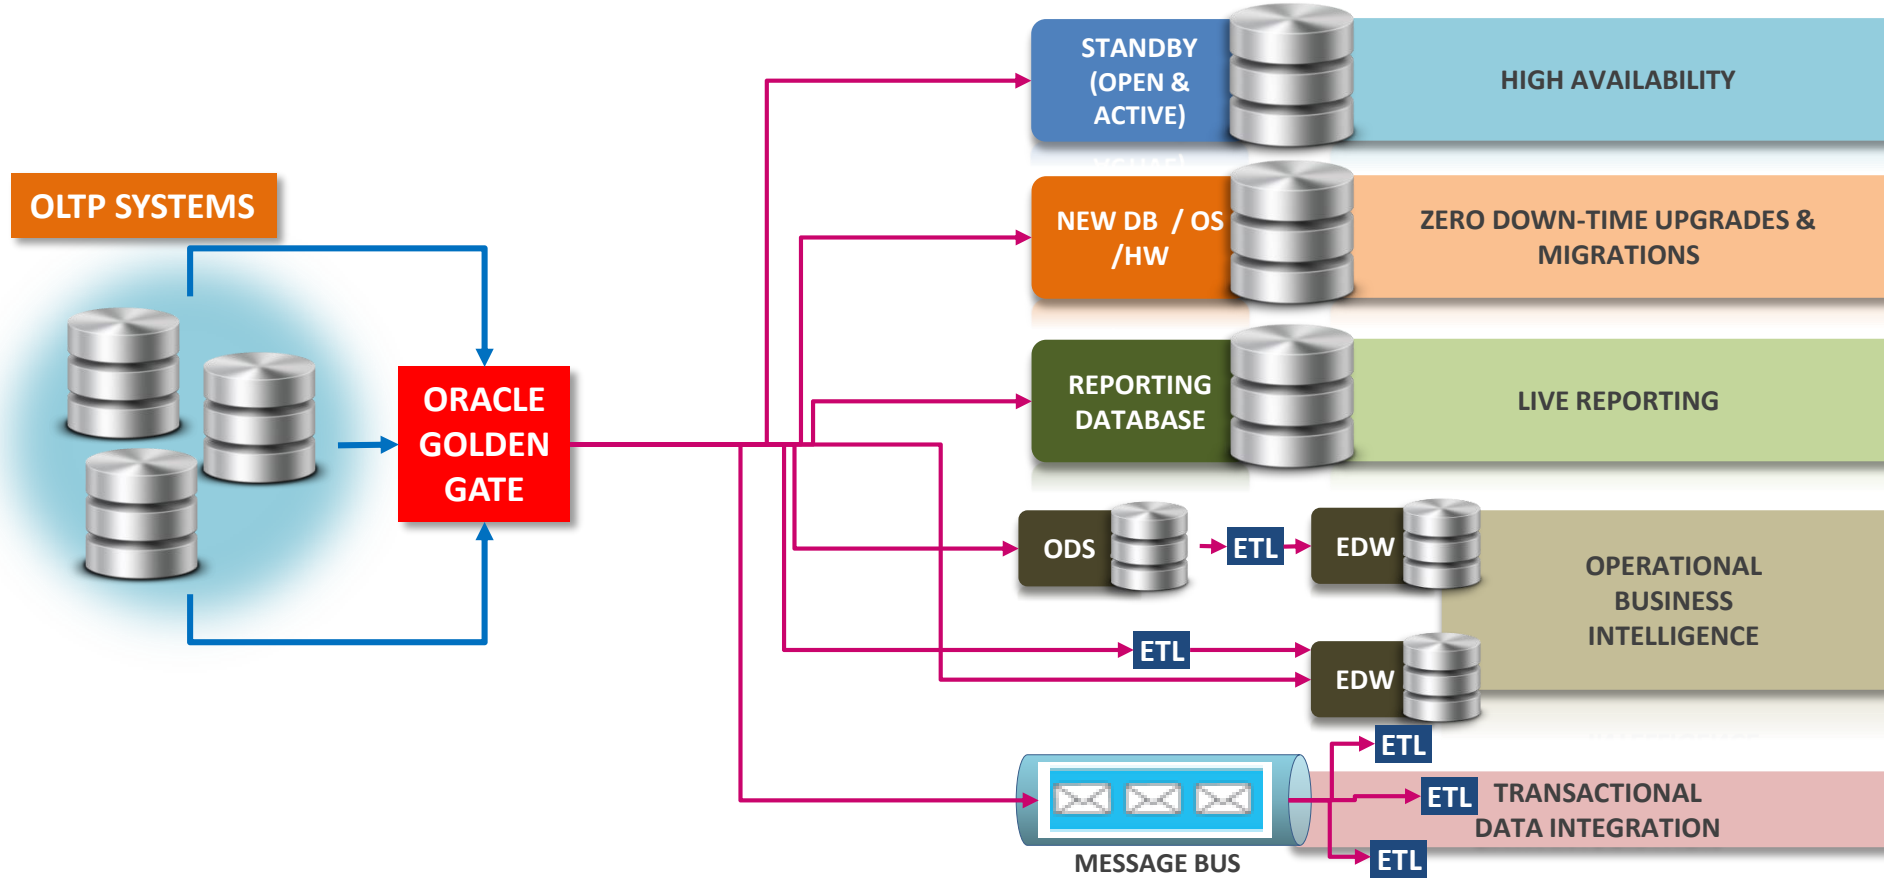

**INTEGRATION / CONSOLIDATION DATA WAREHOUSE**

**CASCADING MARTS**

# Benefits Of Oracle GoldenGate

- ✓ **High Availability (Standby Database)**
  - Load balancing
  - Application Specific HA
  
- ✓ **Zero Down-Time Upgrades and Migrations**
  - Consolidations
  - Database Migrations / Upgrades
    - Platform Migrations (e.g. HP-UX to Linux)
    - Database Upgrades
    - Homogeneous & Heterogeneous
  - Application Upgrades (e.g. Siebel 7 -> Siebel 8)
  - Application Releases (special use cases)
  
- ✓ **Live Reporting (Reporting Database)**
  - Off load reports to a separate system
- ✓ **Operational Business Intelligence**
- ✓ **Transactional Data Integration**

# Benefits Of Oracle GoldenGate

- ✓ Oracle GG is a middleware product designed to work in a heterogeneous environment with different databases.
- ✓ Oracle GG moves only **committed data** across platforms where as Oracle database, which writes **committed and uncommitted** changes to the redo logs.
- ✓ Moves across a TCP/IP network and does not require Oracle Net.
- ✓ Oracle GG will not provide automatic failover like Oracle DG.
- ✓ Oracle GG uses its own Commit Sequence Number (CSN) to identify a transaction which based on the Oracle Database SCN (System Change Number).
- ✓ Complete data recoverability via trail files.

Migrate from non-Oracle databases to Oracle 12c

Upgrade Oracle Database versions 8i, 9i, 10g or 11g to 12c

Upgrade or migrate the database server or operating system

Perform database maintenance

- ✓ Eliminate Down-Time During Oracle Database Upgrades
- ✓ Eliminate Unplanned Down-Time With Active Data Guard
- ✓ Improve Production System Performance
- ✓ Real-Time Reporting from a Lower-Cost System
- ✓ Increase ROI On Existing Servers and Synchronize Global Data
- ✓ Capture can be offloaded from the source DB to an intermediate host by copying the redo logs

## OPERATIONAL REPORTING

# INCREASE ROI ON EXISTING SERVERS & SYNCHRONIZE GLOBAL DATA

ACTIVE - ACTIVE

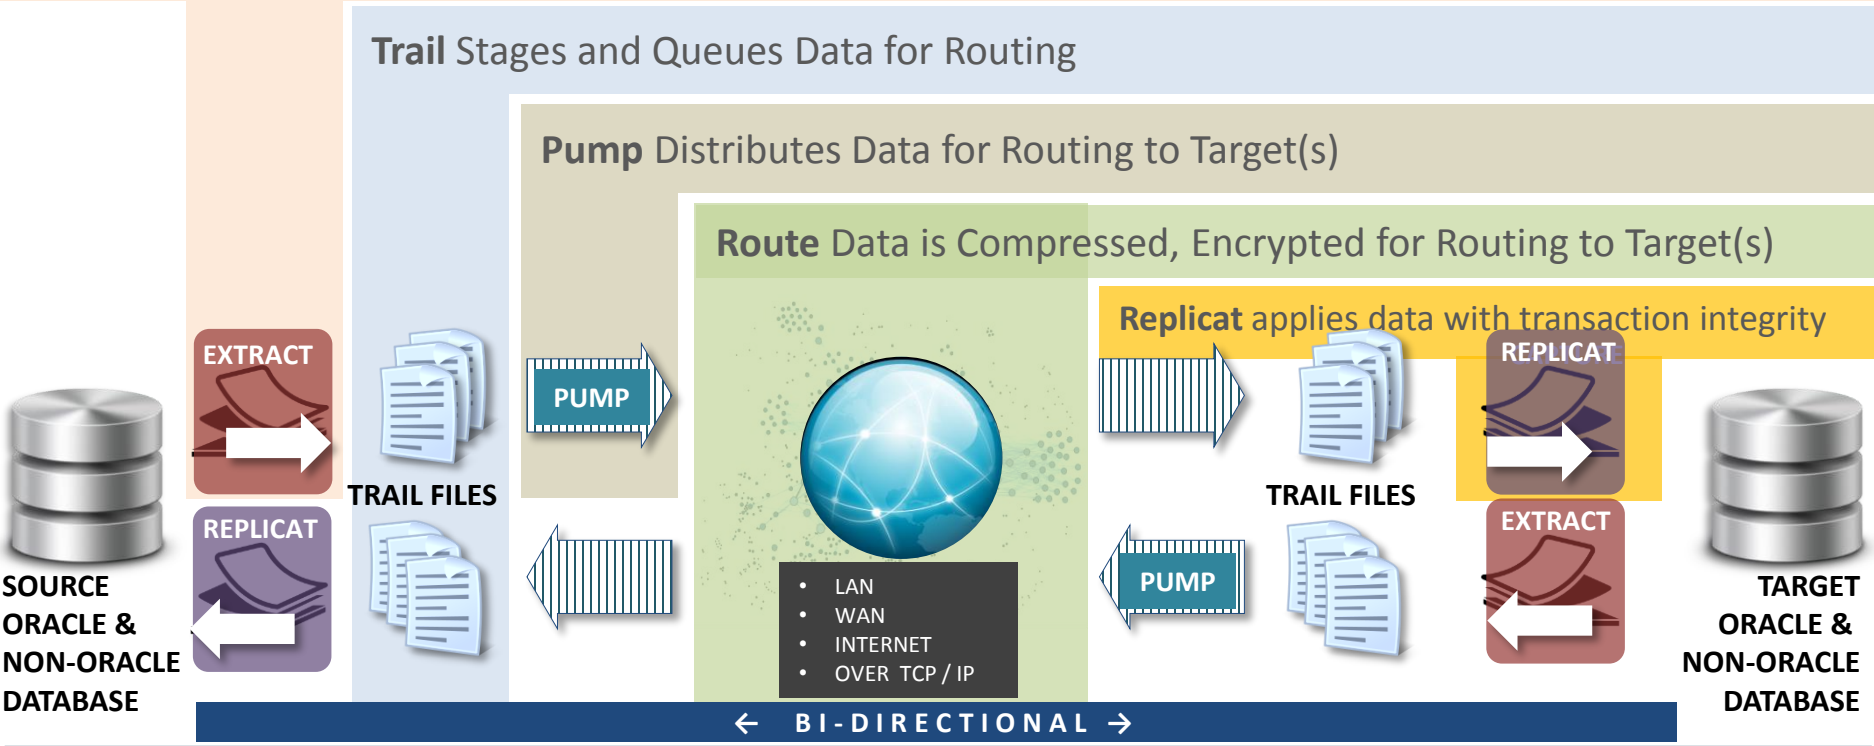

# ORACLE GOLDENGATE – THE WAY IT WORKS

## Extract

Committed transactions are captured (and can be filtered) as they occur by reading the *transaction logs*.

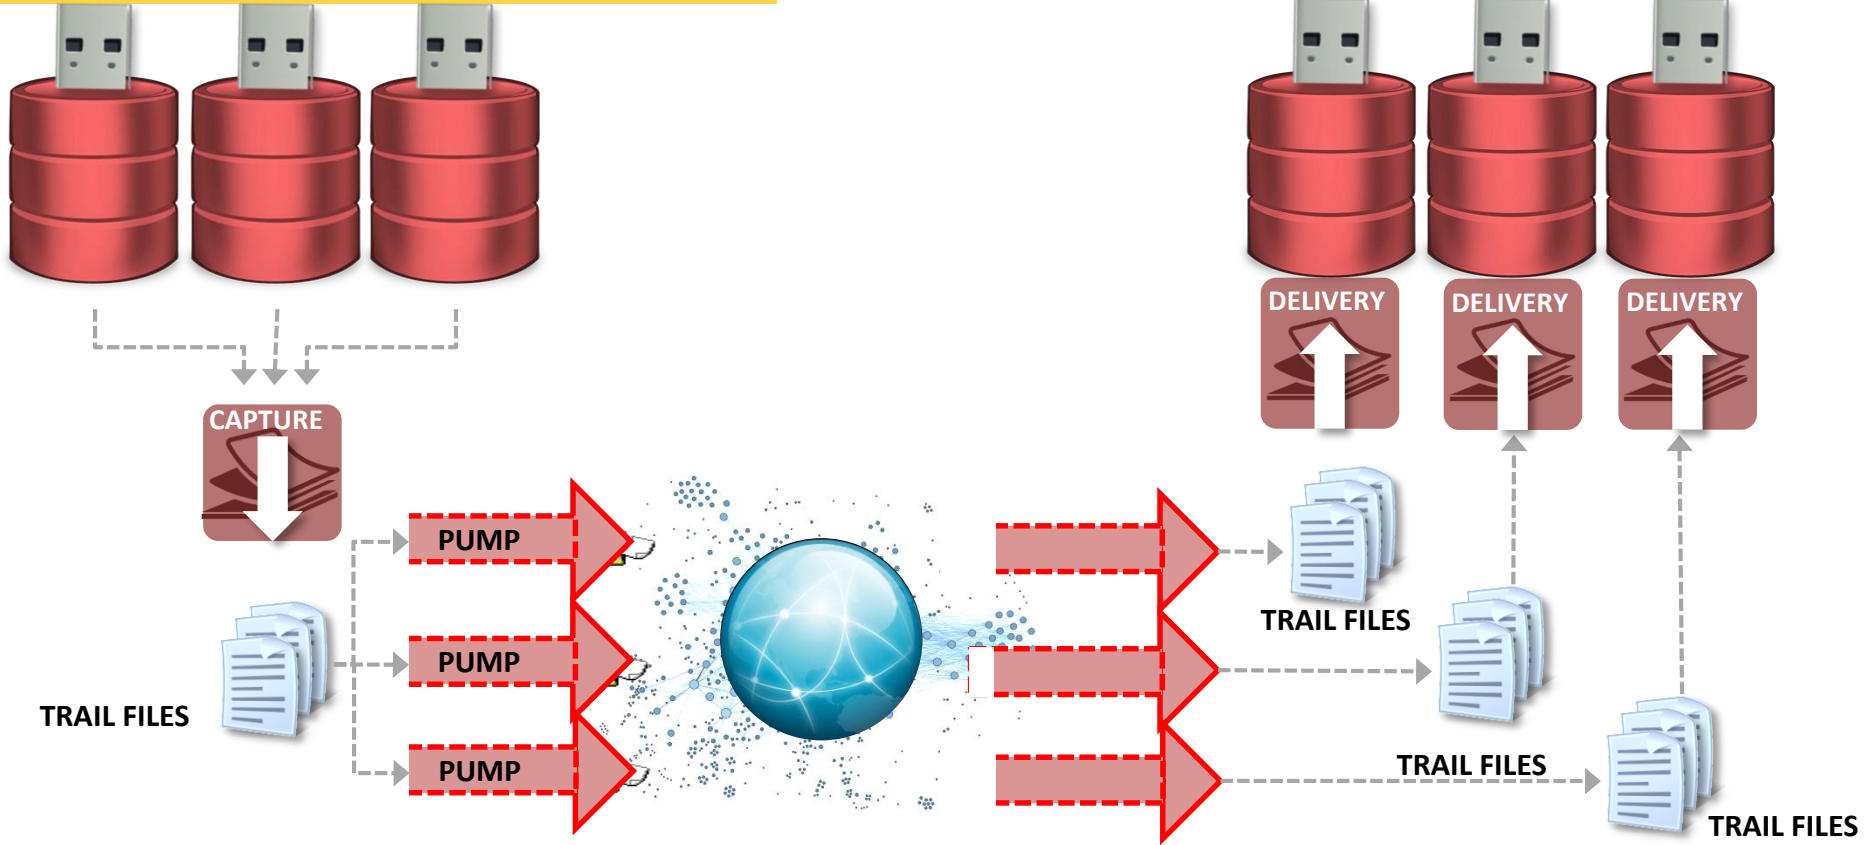

# OPTIMIZED FOR ORACLE 12c

## SOURCE ORACLE 12C MULTITENANT CONTAINER DATABASE

## TARGET ORACLE 12C MULTITENANT CONTAINER DATABASE

# UPDATE DISASTER RECOVERY SITE – IN ONE OPERATION

# MANAGE MANY DATABASES AS ONE

ONE STANDBY DATABASE COVERS ALL PLUGGABLE DATABASES

# ORACLE GOLDENGATE

# Performance Tuning

## Integrated Extract

- ✓ Is an Oracle GoldenGate Extract for Oracle databases (Database Release 11.2.0.3 and later)
- ✓ Is multithreaded & Supports more data types
- ✓ Relies on Oracle's internal log parsing and processing implementation
- ✓ Supports downstream topologies
- ✓ Is new with version 11.2.1.0.0
- ✓ Works with Logminer

Register Extract (capture) with database/logminer required

```
Example: GGSCI> register extract [ name ] database container [ (PDB) ]
```

## Classic Extract

- ✓ Is traditional REDO log-based extract for Oracle
- ✓ Works for all DB platforms and versions

## Classic Extract

- ✓ Oracle Database 11.2.0.3.0 Or earlier, or are running classic mode then the scripts need to be run from SQL \*Plus as **sysdba**
- ✓ Scripts to be executed
  - ✓ @marker\_setup.sql
  - ✓ @ddl\_setup.sql
  - ✓ @role\_setup.sql
  - ✓ Grant role to user
  - ✓ @ddl\_enable.sql
- ✓ DDL Trigger must be enabled

## Integrated Extract

- ✓ No need to run the scripts
- ✓ Requires Oracle Database 11.2.0.4.0 or later
- ✓ DDL Trigger must be disabled for Integrated mode DDL replication

```
GGSCI (ggnode1.oracle.com) 17> info extract eorcl

```

# Oracle GoldenGate Performance Areas

## Source Database

## Target Database

# Install the UTL\_SPADV Package (Integrated Extract and Integrated Replicat)

- ✓ UTL\_SPADV PL/SQL package provides subprograms to collect and analyze statistics for the LogMiner server processes. The statistics help identify any current areas of contention such as CPU or I/O.
- ✓ Oracle Streams Performance Advisor (SPADV) enables monitoring of the integrated GoldenGate server processes which are used by integrated Extract and integrated Replicat, and provides information about how these processes are performing.
- ✓ SPADV statistics are collected and analyzed using the UTL\_SPADV package.
- ✓ UTL\_SPADV package, as the Oracle GoldenGate administrator user on the source database.

## To install SPADV, execute the following steps:

a. Grant the following privileges to a designated Oracle GoldenGate administrator database user:

```
SQL> exec DBMS_GOLDENGATE_AUTH.GRANT_ADMIN_PRIVILEGE(-  
'<db user name>');
```

b. Connect to the database with the user name that was granted permissions in Step a.

c. Run the utlspadv.sql script. For example:

```
SQL> @$ORACLE_HOME/rdbms/admin/utlspadv.sql
```

# Gather Statistics using the UTL\_SPADV Package

- ✓ Oracle recommends that you gather statistics for a 30-60 minute time period during which you are troubleshooting performance.
- ✓ It is also recommended to gather statistics during a 30-60 minute time period where performance is good, serving as a baseline comparison.

To gather statistics every 15 seconds, run the following SQL\*Plus command as the Oracle GoldenGate administrator:

```
SQL> exec UTL_SPADV.START_MONITORING(interval=>15);
```

To stop statistics gathering, run the following command:

```
SQL> exec UTL_SPADV.STOP_MONITORING;
```

Run the following commands to determine if the monitoring job is currently running:

```
SET SERVEROUTPUT ON
DECLARE
is_mon BOOLEAN;
BEGIN
is_mon := UTL_SPADV.IS_MONITORING(
job_name => 'STREAMS$_MONITORING_JOB',
client_name => NULL);
IF is_mon=TRUE THEN
DBMS_OUTPUT.PUT_LINE('The monitoring job is running. ');
ELSE
DBMS_OUTPUT.PUT_LINE('No monitoring job was found. ');
END IF;
END;
/
```

# Generating Report - UTL\_SPADV Package

- ✓ It is also possible to create a static report of SPADV statistics after monitoring for a period of time. The report can be generated in text form much like the display of real-time statistics.
- ✓ To generate a text report, from SQL\*Plus as the Oracle GoldenGate administrator, execute the following:

```
spool /tmp/spadv.txt  
  
begin  
utl_spadv.show_stats(path_stat_table=>'STREAMS$_PA_SHOW_PATH_STAT',  
bgn_run_id=> 1,  
end_run_id=> 9999,  
show_legend=> TRUE);  
end;
```

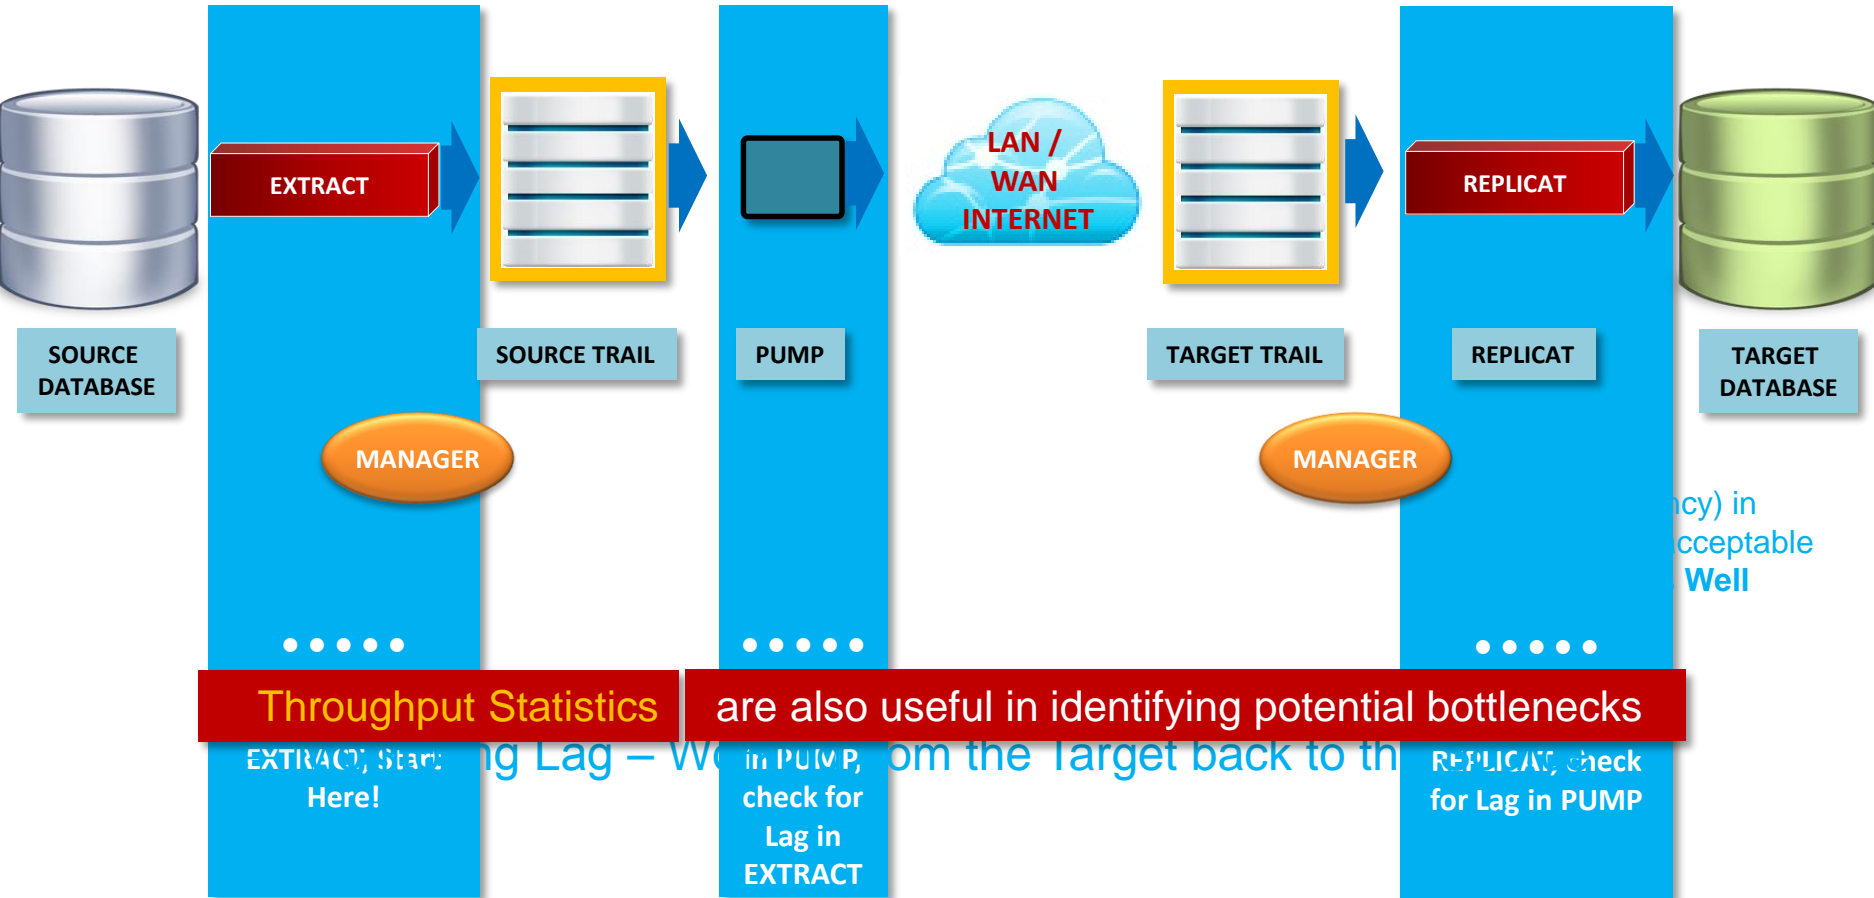

After the reports have been generated, Oracle recommends purging the SPADV statistics using the following command:

```
SQL> exec UTL_SPADV.STOP_MONITORING(PURGE=>TRUE);
```

# Identifying the Bottlenecks

ncy) in acceptable Well
